LogiSense
Advanced IT for Logistics

Trace your goods anytime, anywhere through the entire supply chain

Secure, fast and reliable data exchange

LogiSense fills the software gaps for logistics service providers by connecting to any present system

How does LogiSense work?

LogiSense is a very pluggable system that can fill any software gap for logistic service providers. This means you can keep using the software you are currently using and extend this to connect to your partners and suppliers. LogiSense will provide a secure connector between your system and the system of your partner. This allows you to track and trace goods even when they are handled by independent charters or other partners. No more wasting time on delivery statuses. Just look for the package in your own system and discover where it is, even when it is handled by another partner.

LogiSense keeps connections to partners manageable. Every connection between system consumes effort to build and maintain by your IT department. With increased connectivity and exchange of messages IT effort grows exponentially. Ten partners in a network will create 90 connections if they all connect to each other. With use of LogiSense the amount of connections can be reduced to 10. This means a reduction of IT effort by factor 9!

What are the benefits of LogiSense?

Reduction of paper trail: LogiSense makes it easy to connect your business to others. Most logistics providers already have a system to manage their shipments digitally. When cooperating with another logistic service provider or a charter often communication is still handled via paper documents. Connecting your system to that of others to get rid of the paper trail is a complex and tedious process. LogiSense solves this problem!

Full standards compliance: LogiSense supports industry standards for communication like EDI, so usually only a small connector is needed to connect your own system to LogiSense. Any current software system that supports EDI messaging standards will be able to connect to LogiSense.

IT cost reduction: By reusing connections made to LogiSense a network is build with a minimal amount of connections leading to cost reductions of over factor 10 for small networks. Cost reductions scale up massively with increase of the networks

Private and secure: LogiSense uses state of the art security systems to keep your data safe

Fast and reliable: In Germany located certified data centers make sure LogiSense is always available and fast.

No central storage: LogiSense does not store any of your data. Once the connection is established with help of LogiSense, all data is transferred between peers. This means your data only stays at your own system and the partners you would like to share it with.

LimeTri BV

LimeTri BV is a dutch software development company founded in 2013. Solid base for the company was the team who had been working on the open source farm management system AgroSense for several years already. The LimeTri team consists of IT and logistics experts creating the optimal combination of expertise to implement LogiSense. Years of experience has led to this innovative concept which will change they way businesses will communicate with each other for ever. Our experts are always at your service to help implement the needed connector to LogiSense.
